

As of now, Selenium & Java only Enables. So we are going to try for the below combination(C# & Selenium)

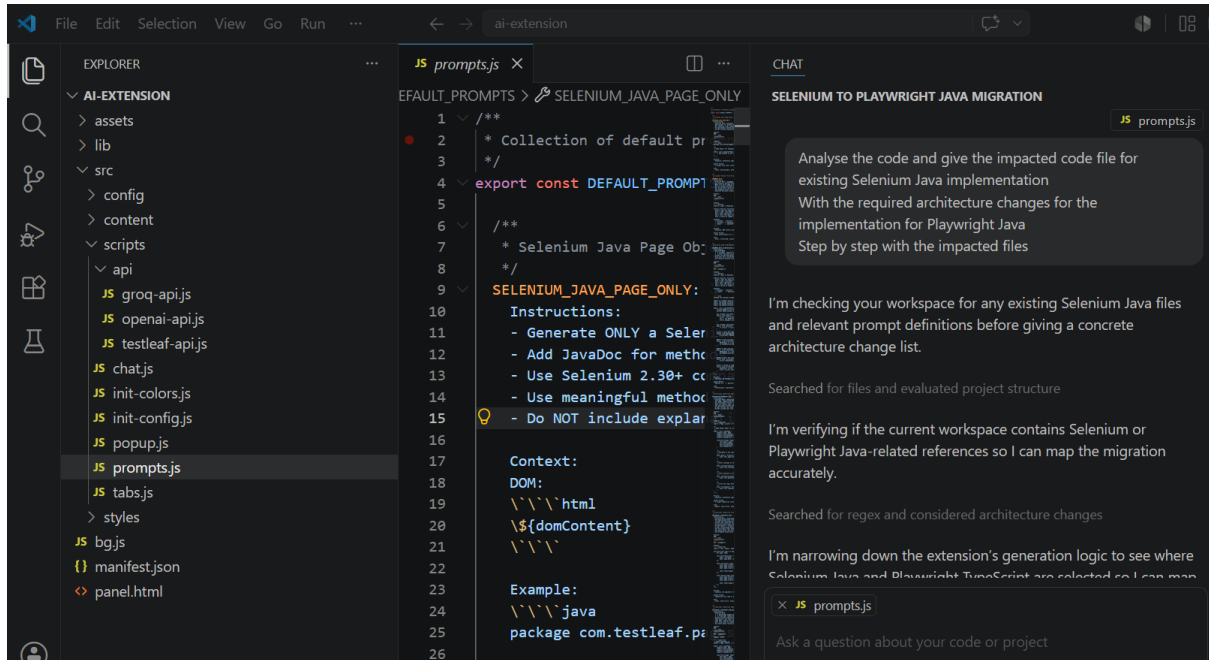

In VS Code, Click on Co-pilot on the top and click Agent & Select Ask

Ask - Answers questions without making changes(It ll implement, it will just show what it ll), **Agent** - Edit files in your workspace in agent mode & **Plan** - Researches and outlines multi-step plans

Ask the below in the agent: Analyse the code and give the impacted code file for existing Selenium Java implementation. With the required architecture changes for the implementation for Playwright Java, Step by step with the impacted files.

After giving the prompt in co-pilot.

Recommended - Recommended final design

Use a separate Playwright Java prompt path, not a variant of Selenium Java. That keeps:

- Java Selenium generation unchanged
- Playwright TypeScript generation unchanged
- new Playwright Java generation isolated and easy to maintain

If you want, I can also give you the exact [prompts.js](#) additions and [chat.js](#) patch needed for supporting Playwright Java.
